***Politicians have been conned by anti-industrial greens to neglect the UK's reliable and economical coal and nuclear generators***

Imagine conditions in the once Great Britain. Ice laden wind turbines sit idle in the still air; solar panels covered in snow; gas reserves down to 8 days; pensioners burning books to keep warm, and a bankrupt government.

This is happening because politicians have been conned by anti-industrial greens to neglect the UK's reliable and economical coal and nuclear generators, while wasting time and money on pointless climate crusades.

Australia is treading this treacherous path. The Wong energy plan will consume our savings, uglify our headlands with wind turbines, cover our deserts with solar panels and entangle our countryside with a spider-web of costly and poorly used transmission lines. And still we will need coal and gas to deliver power when "the wind don't blow and the sun don't shine".

When this global warming madness passes, future generations will remove this derelict solar/wind infrastructure and return to the only reliable and economical electricity options for Australia – coal, gas, hydro and nuclear. Reality exists, even if there are few who recognise it.

For some hard realities on Emissions Targets and Electricity Generation Options for Australia see: <http://carbon-sense.com/2010/01/11/emissions-generation-lang/>
